

A centralized hub for interactive, responsive web games.

Project Overview & Description

Kriyon_Arcade is a centralized multi-game dashboard designed to bring classic, retro, and complex web games into a single, seamless user experience. Instead of maintaining separate deployment pipelines or navigating across multiple sites, this platform consolidates games into an ecosystem governed by a unified dashboard.

Key Features

- **Centralized Hub:** A clean, modern dashboard layout to browse, select, and launch individual games instantly.
- **Optimized Performance:** Fast asset loading, automatic image handling, and zero layout shifts using Next.js font and asset optimization.
- **Responsive Viewports:** Tailored layouts delivering fluid, native-feeling gameplay across mobile, tablet, and desktop screens.
- **Strict Isolation Rules:** Architecture designed to keep game instances independent, preventing scripts or styles from bleeding into other areas of the application.

Games Added

Game Title	Genre	Description / Tech Highlight	Current Status
Chess	Strategy / Board	Powered by complex JavaScript algorithms for move validation, turn-state tracking, board evaluation, and deep game-tree logic.	 In Active Development
RetroSnake	Arcade / Retro	A modern take on the classic arcade snake game, utilizing precise grid-movement algorithms and collision detection.	 Fully Playable
TicTacToe	Casual / Strategy	A clean, fast-paced implementation of the classic game featuring instant win-condition state checks.	 Fully Playable

Tech Stack

- **Framework:** [Next.js](#) (App Router architecture)
- **Language:** [TypeScript](#) / Advanced JavaScript (Algorithmic Logic)
- **Styling:** [Tailwind CSS](#)
- **Font Asset:** Geist (Optimized natively via `next/font`)

Project Folder Structure

To maintain long-term scalability and clean code separation, **Kriyon_Arcade** utilizes a strictly structured directory where each game's assets, routing, components, and independent state modules are fully compartmentalized.

```
├── public/                # Static application assets
